Menu With Input Elements Prefab Creator
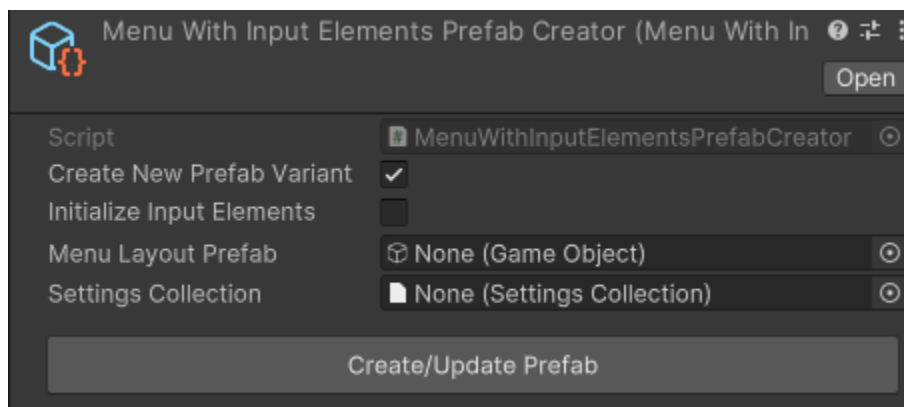

In some cases you want to manually modify the input elements for your settings inside the layout. This prefab creator allows you to create a prefab variant with all input elements for your settings collection. You can freely move your settings around or even delete/modify them as you see fit. If you delete an input element for a setting it will later be generated at runtime like usual. This hybrid or full manual approach gives you the most control over how you want to set up your input elements if the runtime generated workflow can not sufficiently do that.

Create New Prefab Variant
Whether a prefab variant of the prefab referenced in the 'Menu Layout Prefab' field should be generated or if the referenced prefab should be modified directly.

Initialize Input Elements
Whether the input elements inside the prefab should be initialized. This mostly affects the modification of the input element labels.

Menu Layout Prefab
The layout prefab that should be modified or a variant be created for containing the input elements for the settings of the referenced settings collection.

Settings Collection
The settings collection which contains the settings you want to add/modify in the resulting or existing prefab.
